

ARDHRA.K

DATA SCIENTIST INTERN

Pattambi, Kerala, India | +91 8086815193 | ardhrakn047@gmail.com | [LinkedIn](#) | [portfolio](#)

SUMMARY

Motivated Data Science enthusiast with a strong foundation in statistics, Python, and machine learning. Skilled in building classification and regression models, performing feature engineering, hyperparameter tuning, and cross-validation. Proficient in EDA, data visualization (Power BI, Tableau), and SQL for extracting actionable insights. Experienced in model evaluation using metrics such as Accuracy, Precision, Recall, F1-score, R^2 , MAE, and RMSE. Passionate about applying statistical analysis and machine learning to solve real-world problems. Quick learner with strong analytical thinking, eager to grow in deep learning and NLP.

Education

Bachelor of Computer Applications (BCA), SNDP College, Perinthalmanna	2025
CGPA: 7.35 / 10.0	
Class 12th , Kerala Board of Public Examination	2022
Percentage: 79%	
Class 10th ,Central Board of Secondary Education	2020
Percentage: 78.6%	

skills

Programming:Python (Pandas, NumPy, Scikit-learn) ,SQL
Machine Learning & AI:Building and evaluating ML models for real-world problems, Classification & Regression ,Feature Engineering & Selection, Hyperparameter Tuning & Cross-Validation,Model Evaluation.
Data Analysis: Exploratory data analysis (EDA) and applied analytics.
Deep Learning & AI: NLP , RAG ,CNN ,computer vision, LLM , ANN.
Data Visualization: Creating dashboards and visual insights using Power BI and Tableau
Tools: mongoDB, Jupyter notebook, google collab, github, Git.

PROJECT

FLIGHT PRICE ANALYSIS AND PREDICTION

- Built a regression-based predictive model using Linear Regression, Decision Tree, Random Forest, and Gradient Boosting to estimate flight ticket prices from historical travel data
- Engineered features such as journey day/month, departure/arrival time, and duration in minutes from raw airline, route, and stop data to improve model accuracy
- Applied hyperparameter tuning (Random Search / Grid Search) and selected ensemble models (Random Forest / Gradient Boosting) as best performers based on R^2 , MAE, and RMSE
- Identified airline type, number of stops, and travel duration as key pricing drivers, delivering actionable fare insights for travel planning

LIVER PATIENT ANALYSIS

- Built a regression-based predictive model using Linear Regression, Decision Tree, Random Forest, and Gradient Boosting to estimate flight ticket prices from historical travel data
- Engineered features such as journey day/month, departure/arrival time, and duration in minutes from raw airline, route, and stop data to improve model accuracy
- Applied hyperparameter tuning (Random Search / Grid Search) and selected ensemble models (Random Forest / Gradient Boosting) as best performers based on R^2 , MAE, and RMSE
- Identified airline type, number of stops, and travel duration as key pricing drivers, delivering actionable fare insights for travel planning
